Attorney Docket No.: 46417.001012

What is claimed is:

15

- 1. A transmitter chip comprising:
- a first series of phase shifters to control the scan angle and linear polarization of an RF signal;
- a 90° phase shifter to control the circular polarization of an RF signal; and a means for controlling the first series of phase shifters and the 90° phase shifter.
 - 2. The transmitter chip of claim 1, wherein the means comprises a serial-to-parallel converter.
- The transmitter chip of claim 1, wherein the first series of phase shifters
 comprises a 5.625° phase shifter, an 11.25° phase shifter, a 22.5° phase shifter, a 45° phase shifter, and a 90° phase shifter.
 - 4. The transmitter chip of claim 1, wherein the first series of phase shifters further comprises a 3-bit attenuator and three single stage amplifiers.
 - 5. The transmitter chip of claim 1, wherein transistor-transistor logic (TTL) is used to control the polarization and scan angle of an RF signal.
 - 6. The transmitter chip of claim 1, wherein the transmitter chip is capable of generating a signal with a polarization angle in the range of about 0° to 90°.
 - 7. The transmitter chip of claim 1, wherein the transmitter chip is capable of generating a left-hand and right-hand circularly-polarized RF signal.
- 8. The transmitter chip of claim 1, wherein the transmitter chip is capable of generating a left-hand and right-hand circularly-polarized RF signal with very low axial ratios.

PATENT

Attorney Docket No.: 46417.001012

9. The transmitter chip of claim 1, wherein the transmitter chip is capable of generating scan angle in the range of about -45° to 45°.

- 10. The transmitter chip of claim 1, wherein the transmitter chip is using multifunctional self-aligned gate process (MSAG).
- 5 11. The transmitter chip of claim 1, wherein the transmitter chip is capable of providing higher RF yields.
 - 12. An antenna comprising:

10

15

20

a first substrate containing a plurality of transmitter chips, wherein each transmitter chip is comprised of a first series of phase shifters to control the scan angle and linear polarization of an RF signal, a first 90° phase shifter to control the circular polarization of an RF signal, and a first means for controlling the first series of phase shifters and the first 90° phase shifter;

a second substrate containing a plurality of transmitter chips, connected at the output of the first substrate, wherein each transmitter chip is comprised of a second series of phase shifters to control the scan angle and linear polarization of an RF signal, a second 90° phase shifter to control the circular polarization of an RF signal, and a second means for controlling the second series of phase shifters and the second 90° phase shifter; and

a balun substrate connected at the output of the second substrate containing a number of baluns that divides an RF signal into two equal signals that are 180° out of phase with each other.

PATENT

Attorney Docket No.: 46417.001012

- 13. The antenna of claim 12 wherein the first substrate receives the first RF signal and the second substrate receives the second RF signal from an interconnect substrate.
- 14. The antenna of claim 12 wherein the antenna is capable of transmitting with a single operating signal.
- The antenna of claim 12, wherein the balun substrate further comprises a number of radiator elements connected at the output of the baluns.
 - 16. The antenna of claim 15, wherein each of the radiator elements are planar square patch radiator.
- 17. The antenna of claim 12, wherein each of the substrate is designed using MMIC10 technology.
 - 18. The antenna of claim 12, wherein each of the substrate is built using LTCC technology.
 - 19. The antenna of claim 12, wherein the various substrates are interconnected using a Fuzz-bottom interconnect.
- 15 20. The antenna of claim 12, wherein each of the substrate is connected to a aluminum-graphite frame that provides support and heat sinking mechanism for the substrates.
 - 21. The antenna of claim 19, wherein various substrates are connected to the Fuzzbottom interconnect using a film epoxy.
- 20 22. A transmitter chip comprising:
 means for controlling the scan angle and the linear polarization of an RF signal;
 and

Attorney Docket No.: 46417.001012

means for controlling the circular polarization of an RF signal.

- 23. The transmitter chip of claim 22, wherein the means for controlling the circular polarization of an RF signal can generate left-had circularly polarized signal and right-hand circularly polarized signal.
- The transmitter chip of clam 23, wherein the means for controlling the circular polarization of an RF signal can generate left-had circularly polarized signal and right-hand circularly polarized signal with a very low axial ratio.
